

Carte IOT

(Description technique)

LE CREN Anthony

Description des périphériques montés sur la carte Shield

ESP32	ESP8266		Composant	Rôle
12	0	Logique (OUT)	Led rouge	Led de test
17	2	Logique (OUT)	Sortie RS485	Commande de spots DMX
21	4	Logique	SDA : Afficheur OLED	Afficheur OLED et capteur I2C divers
22	5	Logique	SCL : Afficheur OLED	
19	12	Logique	DS18S20	Capteur de température
23	13	Logique (IN)	VS1838B	Capteur infrarouge pour télécommande
18	14	Logique (OUT)	WS2812B	Ruban de 4 leds couleurs
5	15	Logique (OUT)	Emetteur UHF	Passerelle vers un réseau LPWAN
35	A0	Analogique (IN)	Capteur LDR	Capteur de lumière

DMX : ESP8266 : UART1 ou ESP32 : UART2

Configuration du shield en fonction de la carte microcontrôleur :

	J5	J6	J8	J9
ESP8266	Ouvert	Fermé	Ouvert	Fermé
ESP32	Fermé	Ouvert	Fermé	Ouvert

ESP8266

D1 / R1 Pinout

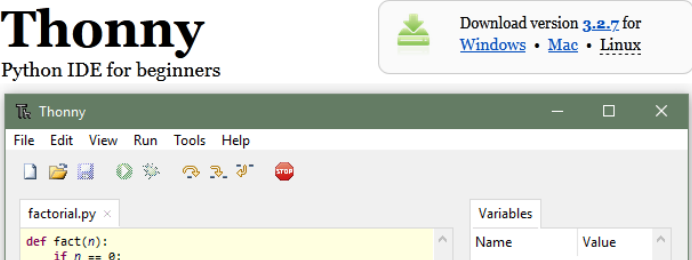

only pins 0, 2, 4, 5, 12, 13, 14, 15, and 16 can be used.

ESP32

Program yo described in the tutorial.</p> <ul style="list-style-type: none"> ◦ esp8266-20191220-v1.12.bin (elf, map) (latest) ◦ esp8266-20190529-v1.11.bin (elf, map)

Flasher le firmware dans le 8266 (<https://micropython.org/download/esp8266/>)

Avec nodemcu firmware programmer disponible ici : <https://github.com/f4goh/NSI>

<https://micropython.org/download#esp8266>

Firmware for ESP8266 boards

The following files are stable firmware for the ESP8266. Program your board using the esptool.py program as described in the tutorial.

- **esp8266-20190529-v1.11.bin** (elf, map) (latest)
- esp8266-20190125-v1.10.bin (elf, map)
- esp8266-20180511-v1.9.4.bin (elf, map)
- esp8266-20171101-v1.9.3.bin (elf, map)
- esp8266-20170823-v1.9.2.bin (elf, map)
- esp8266-20170612-v1.9.1.bin (elf, map)
- esp8266-20170526-v1.9.bin (elf, map)
- esp8266-20170108-v1.8.7.bin (elf, map)

The following are daily builds of the ESP8266 firmware. They are not automatically started, and debugging is enabled by default.

- esp8266-20190610-v1.11-37-g62f004ba4.bin (elf, map)

Télécharger le fichier firmware pour l'esp32 (<https://micropython.org/download/esp32/>)

Firmware with ESP-IDF v3.x

Firmware built with ESP-IDF v3.x, with support for BLE, LAN and PPP:

- GENERIC : [esp32-idf3-20200607-unstable-v1.12-510-g1e6d18c91.bin](#)
- GENERIC : [esp32-idf3-20200605-unstable-v1.12-496-ge54626f4c.bin](#)
- GENERIC : [esp32-idf3-20200602-unstable-v1.12-483-g22806ed5d.bin](#)
- GENERIC : [esp32-idf3-20200529-unstable-v1.12-478-g1662a0b06.bin](#)
- **GENERIC : [esp32-idf3-20191220-v1.12.bin](#)**
- GENERIC : [esp32-idf3-20190529-v1.11.bin](#)
- GENERIC : [esp32-idf3-20190125-v1.10.bin](#)
- GENERIC : [esp32-idf3-20180511-v1.9.4.bin](#)

Sélectionner le fichier binaire (1), préciser l'adresse de programmation (2), sélectionner le bon port de communication (3), relier un fil entre la masse GND et l'entrée GPIO 0 (PGM Enable) puis programmer le firmware : start (4)

The image shows two side-by-side components. On the left is a diagram of an ESP32 board with pins labeled. A bracket labeled "PGM Enable" connects the GND pin to the EN pin. On the right is a screenshot of the "ESP32 DOWNLOAD TOOL V3.8.5" software interface. The "SPIDownload" tab is active. A file path "icrobot\esp32\esp32-idf3-20191220-v1.12.bin" is selected in the file list, with a red "1" next to it. The address "0x1000" is entered in the adjacent field, with a red "2" next to it. The "SpiFlashConfig" section shows "SPI SPEED" set to 40MHz and "FLASH SIZE" set to 32Mbit. The "Download Panel 1" shows the "Download" button (with "下载中..." below it) and a red "4" next to it. The "COM" port is set to "COM42" (with a red "3" next to it) and the "BAUD" rate is "921600".

Faire un reset de la carte esp32 **avant** de lancer Thonny IDE

Programmation du firmware Micropython sous Linux :

Pour programmer le firmware de l'esp32, il faudra installer esptool sous linux en ligne de commande

<https://github.com/espressif/esptool>

```
sudo apt install python-pip
sudo pip install --upgrade pip
sudo pip install esptool
pip install pyserial
sudo pip install pyserial
```

Repérer le port série de la carte esp32

```
nsi@nsi-LIFEBOOK-A555:~$ ls /dev/tty*
/dev/tty17 /dev/tty32 /dev/tty48 /dev/tty63 /dev/ttyS2 /dev/ttyS7
/dev/tty18 /dev/tty33 /dev/tty49 /dev/tty7 /dev/ttyS20 /dev/ttyS8
/dev/tty19 /dev/tty34 /dev/tty5 /dev/tty8 /dev/ttyS21 /dev/ttyS9
/dev/tty2 /dev/tty35 /dev/tty50 /dev/tty9 /dev/ttyS22 /dev/ttyUSB0
/dev/tty20 /dev/tty36 /dev/tty51 /dev/ttyprintk /dev/ttyS23
/dev/tty21 /dev/tty37 /dev/tty52 /dev/ttyS0 /dev/ttyS24
/dev/tty22 /dev/tty38
/dev/tty53 /dev/ttyS1 /dev/ttyS25
```

Télécharger le firmware pour l'esp32 (<https://micropython.org/download/esp32/>)

Standard firmware:

- [esp32-20190610-v1.11-37-g62f004ba4.bin](#) (latest)
- [esp32-20190529-v1.11.bin](#)
- [esp32-20190125-v1.10.bin](#)
- [esp32-20180511-v1.9.4.bin](#)
- [esp32--bluetooth.bin](#)

Renommer le fichier par esp32.bin

Exécuter les 2 commandes suivantes :

```
python esptool.py --port /dev/ttyUSB0 erase_flash
python esptool.py --chip esp32 --port /dev/ttyUSB0 write_flash -z 0x1000
esp32.bin
```

Commandes afin de changer l'adresse MAC de l'ESP32 si nécessaire

```
python espfuse.py --port /dev/ttyUSB0 summary
python espfuse.py --port /dev/ttyUSB0 dump
python espfuse.py --port /dev/ttyUSB0 mac
python espfuse.py --port /dev/ttyUSB0 get_custom_mac
python espfuse.py --port /dev/ttyUSB0 burn_custom_mac de:ad:be:ef:fe:00
python espfuse.py --port /dev/ttyUSB0 get_custom_mac
```

Différences des modules préinstallés entre l'ESP8266 et l'ESP32

Esp8266

MicroPython v1.12 on 2019-12-20; ESP module with ESP8266

Type "help()" for more information.

```
>>> help("modules")
```

<code>__main__</code>	<code>http_client_ssl</code>	<code>uasyncio/__init__</code>	<code>upysh</code>

<code>flashbdev</code>	<code>ucollections</code>	<code>upysh</code>	<code>websocket_helper</code>

Plus any modules on the filesystem

```
>>>
```

La liste dans l'ESP32 est moins abondante que dans l'ESP8266.

Il y a moins de modules préinstallés dans l'ESP32.

Pour ajouter le module gérant l'afficheur OLED ssd1306, procéder comme suit :

Exécuter le script suivant en adaptant le nom du point d'accès WIFI (SSID) avec son mot de passe

```
"""
wifi connexion
"""
import network
# user data
ssid = "Livebox-xxxx" # wifi router name
pw = "xxxxxxxxxxxxxxxxxxxx" # wifi router password

# wifi connection station mode
wifi = network.WLAN(network.STA_IF)
wifi.active(True)
wifi.connect(ssid, pw)

# wait for connection
while not wifi.isconnected():
    pass

# wifi connected
print(wifi.ifconfig())
```

Vérifier la connexion sur le point d'accès WIFI. Adresse IP.

Puis dans la console exécuter les 2 lignes suivantes :

```
>>> import upip
>>> upip.install('micropython-ssd1306')
```

```
>>> %Run -c $EDITOR_CONTENT
I (601679) phy: phy_version: 4102, 2fa7a43, Jul 15 2019, 13:06:06, 0, 2
('192.168.1.126', '255.255.255.0', '192.168.1.1', '192.168.1.1')

>>> upip.install('micropython-ssd1306')
Installing to: /lib/
Installing micropython-ssd1306 0.2 from https://files.pythonhosted.org/packages/4d/2b/de6cd81e86782c87bdfd57066ae917aba453d0f89b54f2080c6d4b150e45/micropython-ssd1306-0.2.tar.gz
>>> import ssd1306
>>> |
```

Il en va de même pour l'installation d'autres modules ou bibliothèques ci celles-ci sont disponibles sur le net. <https://pypi.org/project/micropython-ssd1306/>

Si le message suivant apparaît, cela veut dire que l'esp32 n'est pas connecté au point d'accès Internet

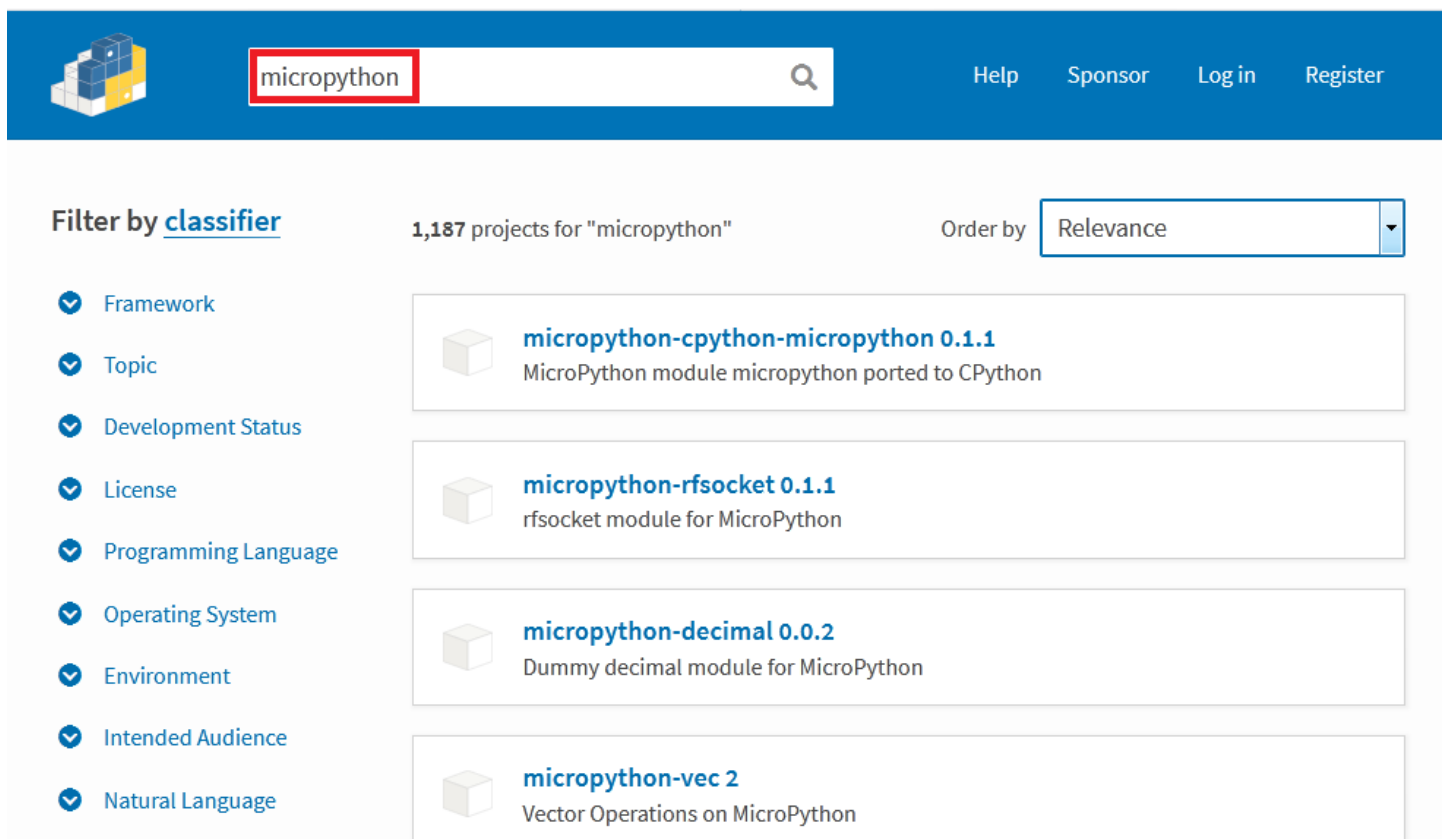

```
>>> upip.install('micropython-ssd1306')
Installing to: /lib/
Error installing 'micropython-ssd1306': list index out of range, packages
may be partially installed
```

Quelques exemples d'installation

```
>>> import upip

```

Pour connaître les bibliothèques compatibles avec micropython, effectuer une recherche sur le site pypi.org.

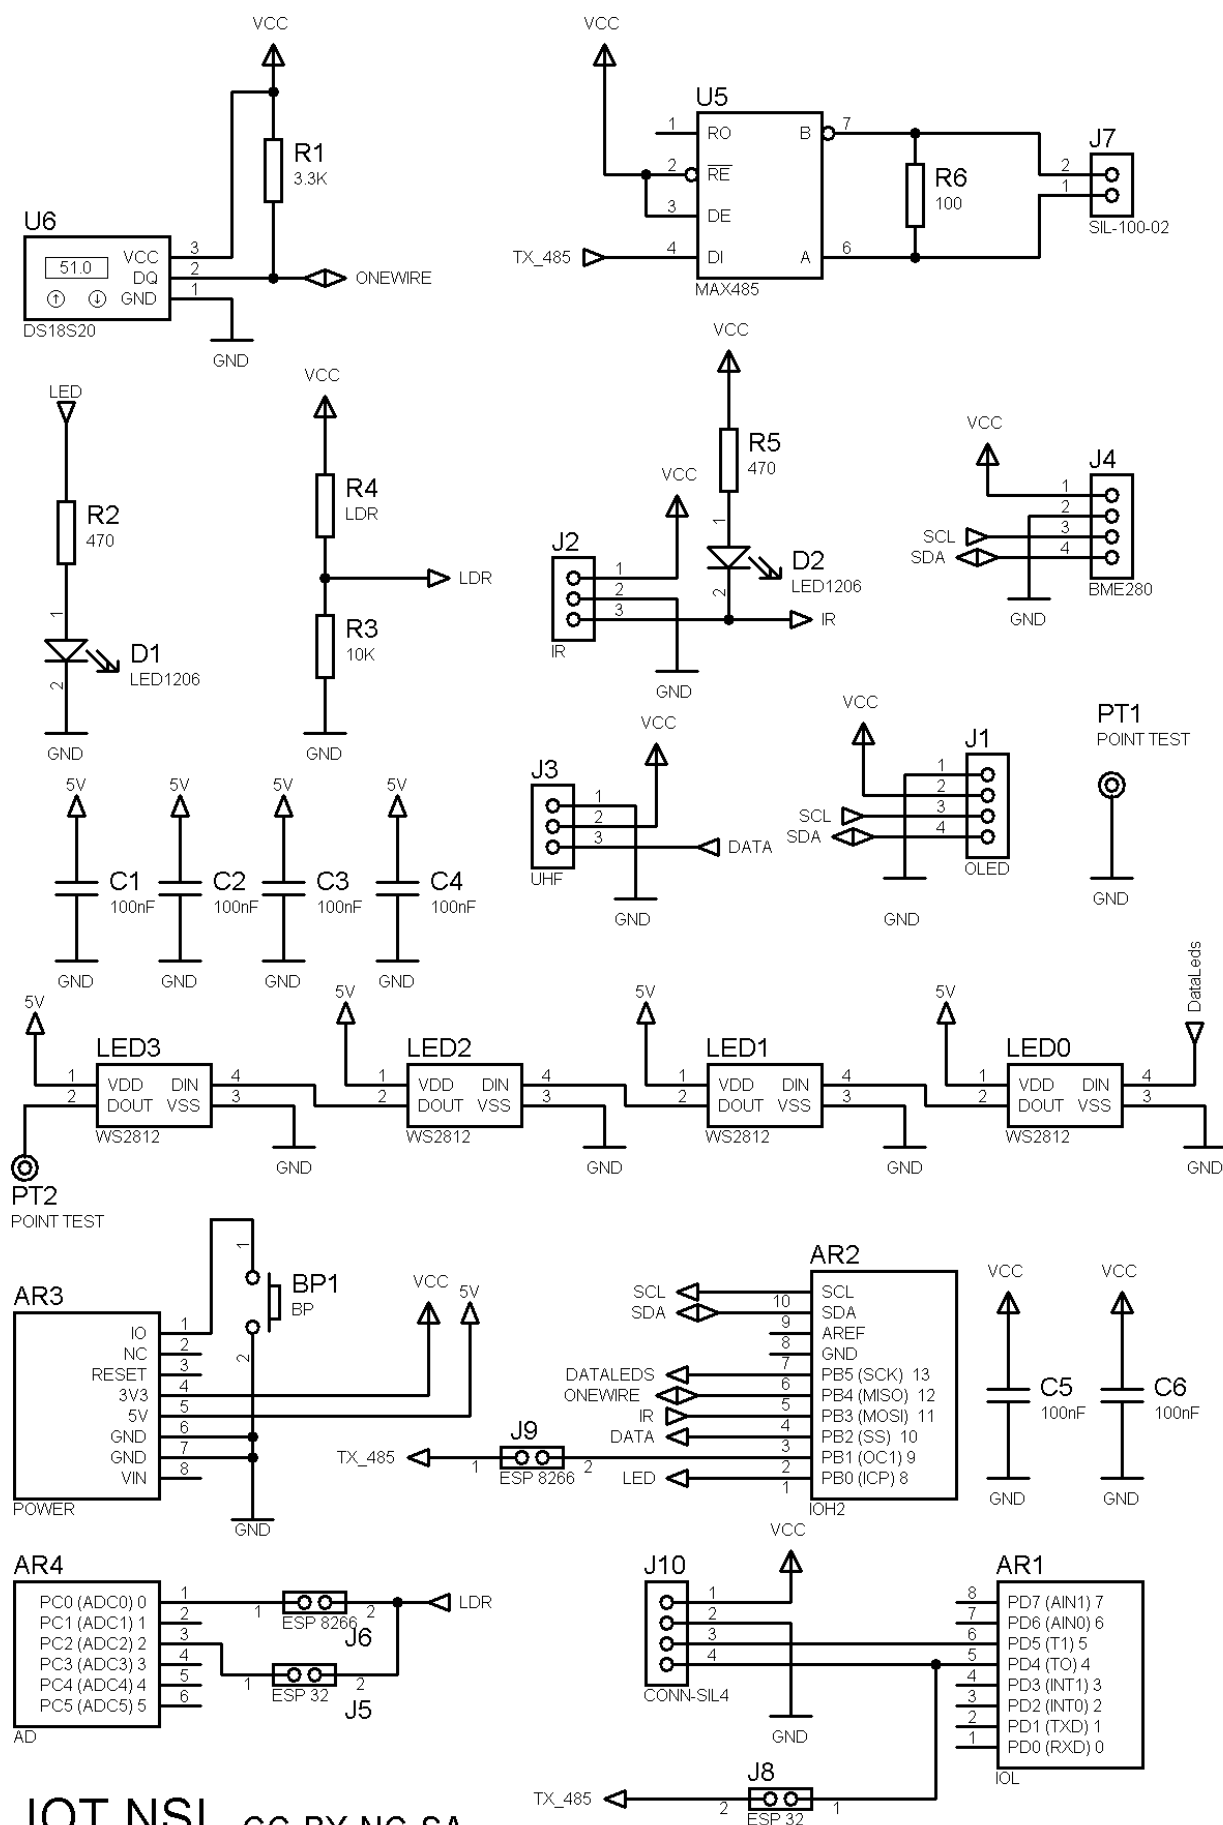

<https://pypi.org/search/?q=micropython>

The screenshot shows the PyPI search results for 'micropython'. The search bar at the top contains 'micropython'. Below the search bar, there are filters on the left and a list of results on the right. The filters include Framework, Topic, Development Status, License, Programming Language, Operating System, Environment, Intended Audience, and Natural Language. The results list shows four projects: micropython-cpython-micropython 0.1.1, micropython-rfsocket 0.1.1, micropython-decimal 0.0.2, and micropython-vec 2. Each result includes a small icon and a brief description.

Filter by classifier	1,187 projects for "micropython"	Order by Relevance
<input checked="" type="checkbox"/> Framework	 micropython-cpython-micropython 0.1.1 MicroPython module micropython ported to CPython

Comment configurer le proxy (utile dans un lycée avec Raspbian)

<https://www.raspberrypi.org/documentation/configuration/use-a-proxy.md>

Configuration de raspbian via le terminal

```
sudo nano /etc/environment
```

```
export http_proxy="http://username:password@proxyipaddress:proxyport"
export https_proxy="http://username:password@proxyipaddress:proxyport"
export no_proxy="localhost, 127.0.0.1"
```

Pour que vos commandes via sudo gardent ces paramètres,

```
sudo visudo
```

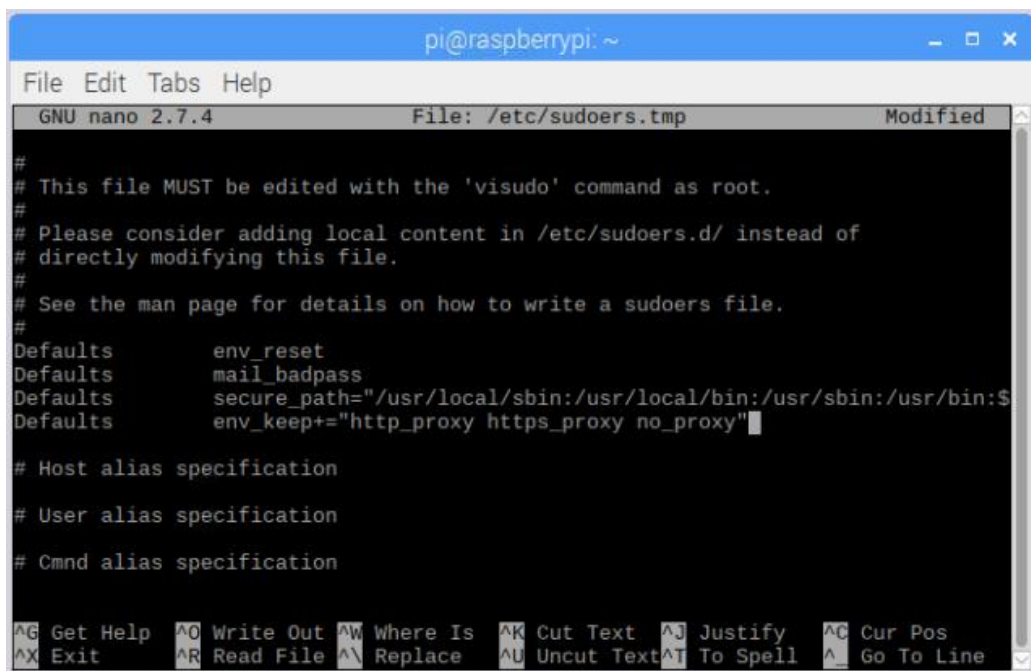

```
Defaults    env_keep+="http_proxy https_proxy no_proxy"
```

Pour que le système de package APT utilise le proxy, créer un fichier 10proxy dans /etc/apt/apt.conf.d/ :

```
cd /etc/apt/apt.conf.d
sudo nano 10proxy
```

```
Acquire::http::proxy "http://username:password@proxyipaddress:proxyport";
```

```
Acquire::https::proxy "http://username:password@proxyipaddress:proxyport";
```

```

Annexe 9 : Commande REPL avec pyQT

REPL signifie « Read Evaluate Print Loop ». C'est le nom donné à l'invite interactive MicroPython à laquelle on accède avec l'ESP8266 ou l'ESP32. L'utilisation de REPL est de loin le moyen le plus simple de tester votre code et d'exécuter des commandes.

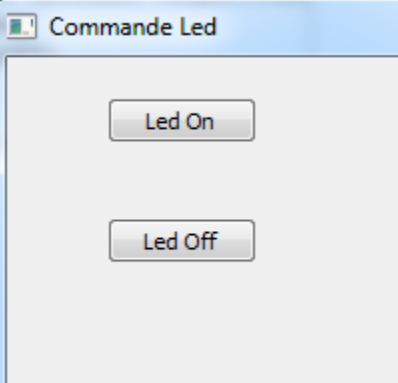

Il y a deux façons d'accéder au REPL : Soit via une connexion filaire via le port série UART, soit via WiFi.

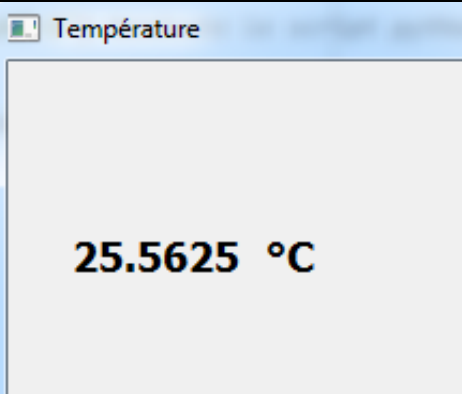

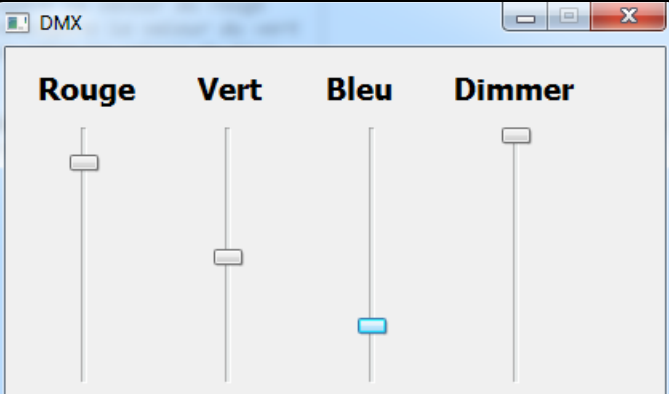

Le REPL est toujours disponible sur le périphérique série UART0, (GPIO1 pour TX et GPIO3 pour RX). Le débit est de 115200 bauds. C'est le moyen le plus simple d'utiliser micropython sur la carte Shield IOT.

Commencer par lire le tutoriel de pyQT (**pyQT.pdf**) en utilisant Edupython

Exemple N°1 : Commande d'une Led (5 fichiers) : `commandeLed.py`

 <code>commandeLed.py</code>	Programme principal exécuté dans Edupython
 <code>commandeLed.ui</code>	Fichier XML (description de la fenêtre graphique)
 <code>led_off.py</code>	Script ESP pour éteindre la led
 <code>led_on.py</code>	Script ESP pour allumer la led
 <code>pyboard.py</code>	Bibliothèque pyboard (REPL)

	Quand on appuie sur les boutons les scripts correspondants sont envoyés et exécutés dans l'ESP.	
	<pre>from machine import Pin from time import sleep_ms #led = Pin(0,Pin.OUT) led = Pin(12,Pin.OUT) led.on() print("led on")</pre>	<pre>from machine import Pin from time import sleep_ms #led = Pin(0,Pin.OUT) led = Pin(12,Pin.OUT) led.off() print("led off")</pre>

Exemple N°1 : Lecture périodique de température (<code>afficheTemperature.py</code>)	Exemple N°3 : Commande RVB DMX avec la bibliothèque <code>Dmx.py</code> (<code>commandeDmx.py</code>)
	

Annexe 10 : Envoyer des emails

Configurer le compte Gmail afin d'avoir un accès moins sécurisé pour l'envoi des messages.

[Télécharger et installer](#) le fichier `umail.py` dans l'ESP

Vérifier la connexion WIFI sur le réseau internet (page 22)

Envoyer un message en connexion TLS/STARTTLS sur le port 587

```
import umail
smtp = umail.SMTP('smtp.gmail.com', 587,
username='nsi.touchard@gmail.com', password='xxxxxxx')
smtp.to('f4goh@orange.fr')
smtp.send("This is an example.")
smtp.quit()
```

Envoyer un message en connexion SSL sur le port 587

```
import umail
smtp = umail.SMTP('smtp.gmail.com', 465, ssl=True) # Gmail's SSL port
smtp.login('nsi.touchard@gmail.com', 'xxxxxxx')
smtp.to('f4goh@orange.fr')
smtp.write("From: Bob <nsi.touchard@gmail.com>\n")
smtp.write("To: Alice <f4goh@orange.fr>\n")
smtp.write("Subject: Poem\n\n")
smtp.write("Roses are red.\n")
smtp.write("Violets are blue.\n")
smtp.write("...\n")
smtp.send()
smtp.quit()
```
